Viral family association networks across coral health states

Project-matched DNA viromes from Orbicella faveolata coral tissue at five Florida locations.
Panels a,b show the 11-family stable-edge union; topology tests retain all 18 families.

c Stability of the 17-edge union

Cells show retention across 500 site-balanced bootstrap resamples; dot, retention >= 50% (not a P value). Bars show descriptive SCTLD - Healthy change.

Topology of the full 18-family candidate set

Distributions show 500 descriptive site-balanced bootstrap resamples.
P values use 999 within-location label permutations and BH correction across eight metrics.
